

Mobile Developer – Test

The purpose of this test is to see how you approach a problem and what your solutions look like. The requirements for this test are simple and should be straightforward to grasp. When implementing a solution, please keep things simple as well.

Please include animation while swiping left to right (e.g. like in Photos app). Navigation bar in the above example looks very crappy. It can be improved.

For data you can parse the JSON from the following url:

<http://www.androidbegin.com/tutorial/jsonparsetutorial.txt>
and pick random country to display.

When hitting the button from page 2, swipe back to page 1.

Your solution:

Please implement your solution as an App that we can try out. For Android we need 4.2 + 4.3 compatibility or for iOS 7 and 8 compatibility. Also send us the source code to your solution. if you put your source code into a GitHub repository, it will make our life easy. A clean, well-animated, beautiful UI is very important. Please, let your imagination fly here. The application should work well in landscape and portrait mode.
